Process Overview

Large Language Model(LAMA 3.2 3B):

This is a pre-trained language model you use for natural language understanding and generation tasks, built on top of a 3.2 billion parameter architecture.

Embedding Model(BAAI/bge-m3):

Used for transforming raw data into vector embeddings, which are essential for representing textual information in a format suitable for similarity search or downstream tasks like classification and retrieval.

Vector Database(Chromadb):

Used to store the generated embeddings as vectors, enabling efficient similarity searches.
