

* Login
all required fields
scope
grant_type
client_id
client_secret

after log in it will give

token_type
expires_in
ext_expires_in
access_token

* Create Order Workflow

check order existence with the accession no.[if exists (order already exist.)]

* check for doctor int the system either First name and last name (Contain) or User UID
user not exists create
call the HLC user list and get the required fields to create the user.
if the user can't match with HLC then default assign [Doctor Admin as Doctor]

* assign room for order by room name[if name not matched randomly assign]
* set order status accordingly [null,2 ="Arrived"; 1="Scheduled"; 3=Completed;]
* check for item with item id and name
if not exists then check with uid
if also not matched the default assign [EGD].

* checking Patient with HN
if not exists then create new Patient.

Lastly create the order
